BREWSURE™

 perftech

*Superior Science.
Superior Perforation.
Superior Performance.*

BrewSure™

Our new BrewSure™ line represents a revolutionary change in the way tea will be brewed in the future. Tea packers will now be able to offer their blends in a variety of micro-perforated substrates featuring a range of transparencies and infusion rates. This gives brand owners a powerful new way to differentiate their product in an already crowded marketplace.

Imagine being able to enhance your product's visual appeal and taste without additional investment in equipment or material.

BrewSure™ is a proven, cost competitive alternative to Abaca paper and woven Nylon and is available today.

A unique perforating process creates exceptional infusion rates which can be tailored to your specific blend.

Versatile

This product range can be run on most common tea packaging machines presently available in the market with no additional equipment investment or loss in production speed.

Proven

Made from DuPont Mylar™ Polyester a world leader in food grade packaging, the material is approved for food applications and backed by one of the world's premier packaging companies.

Environmentally Friendly

When compared to sealable Abaca paper, the Mylar™ Polyester offers distinct advantages in source reduction and recyclability.

Custom Made

With a range of transparency levels and perforation patterns, BrewSure™ can be tailor made for your specific blend. Want to prominently display your colorful, value added, blend? Chose a transparent base material. Want to increase infusion rates for faster preparation? Chose a perforation pattern with higher density of perforations.

Economical

BrewSure™ is cost competitive with any currently available packaging material for tea bags while offering significant advantages in appearance and taste.

Sales and Distribution

Brewsure™ is fabricated by Perftech, Inc. and is available in North America exclusively through Polymeric Film and Bags. Call today for samples or to request a quote.

BrewSure™ material can be formed into dual chamber, pyramid and pod shaped bags.
